

Biodiversity Conservation and No Gross Deforestation Commitment

Coretronic Corporation firmly believes that promptly addressing and effectively reducing the adverse impacts of climate change and global warming on the environment, society, and economy is a core responsibility and mission of its sustainable development. To maintain biodiversity and end deforestation, Coretronic actively promotes actions for the protection of natural ecosystems through the three pillars of “Conservation, Restoration, and Education,” aiming to enhance the resilience and adaptability of Earth's ecosystems.

Commitment

Supporting the United Nations Convention on Biological Diversity (CBD), Coretronic is committed to reducing the environmental impact of its operations, conserving biodiversity, and fostering shared value across the value chain. Coretronic and its value chain will avoid operational activities near sites with globally or nationally significant biodiversity to achieve Net Positive Impact, No Net Loss, and No Gross Deforestation by 2050, with the goal of achieving a vision of harmonious coexistence between technology and nature.

Strategy

1. Plan and conduct biodiversity risk assessments for operational sites located near nationally significant biodiversity areas. Formulate appropriate management approaches and strategic objectives based on the assessment results to achieve no net loss.
2. Support the protection and restoration of natural habitats, avoid operational activities in areas of significant biodiversity, minimize impacts on ecosystems, and promote biodiversity health and sustainability.
3. Prioritize suppliers adhering to sustainability standards, avoid using energy resources from illegal logging or ecosystem disruption, and implement a circular economy to reduce dependence on natural capital to achieve no gross deforestation.
4. Implement energy resource circularity, waste reduction, and other measures to mitigate the impacts on biodiversity caused by climate change, resource consumption, and pollution emissions, thereby alleviating biodiversity loss.
5. Use paper packaging products certified by the Forest Stewardship Council (FSC) or containing recycled pulp for product shipment cartons, thereby reducing the destruction of primary habitats and deforestation.
6. Participate in key domestic and international biodiversity initiatives, collaborating with external experts to stay informed about biodiversity developments and plan long-term strategies. Integrate internal and external resources to engage in ecological conservation efforts, promote environmental education, and undertake reforestation and restoration activities, thereby enhancing species survival and fostering ecological harmony.
7. This commitment applies to the Company’s operational sites, key suppliers, and partners. Coretronic hopes all stakeholders will jointly adhere to and implement best practices for biodiversity protection and zero deforestation to safeguard the natural ecosystem.
